HEALTH EFFECTS
Inhalation - Acute Exposure
Aluminum sulfate: Inhalation may cause irritation of mucous membranes with sore throat and cough due to sulfuric acid which is formed by the hydrolysis of the salt upon contact with moisture.

Inhalation - Chronic Exposure
Aluminum sulfate: Repeated or prolonged exposure may cause bronchial irritation, leading to nocturnal wheezing, and breathlessness. Prolonged inhalation of dusts containing high concentrations of aluminum have produced emphysema, non-nodular pulmonary fibrosis and fatalities.

Skin Contact - Acute Exposure
Aluminum sulfate: Aluminum sulfate hydrolyzes readily with moisture to form some sulfuric acid which may produce irritation, dermatosis and eczema. Excessive formation of sulfuric acid may produce possible burns. Aluminum sulfate may rarely cause skin sensitization.

Skin Contact - Chronic Exposure
Aluminum sulfate: Repeated or prolonged contact with some soluble salts of aluminum results in acid irritation from hydrolysis. A congestive, anesthetic condition of the fingers (acroanesthesia) may occur from prolonged contact. Repeated exposure may result in sensitization.

Eye Contact - Acute Exposure
Aluminum sulfate: May cause irritation, redness, and corneal burns due to the reaction of the compound with moisture to form sulfuric acid.

Eye Contact - Chronic Exposure
Aluminum sulfate: Repeated or prolonged contact with irritants may cause conjunctivitis or effects similar to those for acute exposure.

Ingestion - Acute Exposure
Aluminum sulfate: Ingestion of a large dose was lethal in mice. Aluminum salts, particularly concentrated solutions (20%), may produce gingival necrosis and fatal hemorrhagic gastroenteritis, in coordination, colonic contractions, evidence of nephritis and death.

Ingestion - Chronic Exposure
Aluminum sulfate: No data available.
